PATENT APPLICATION Serial No. 10/767,600

## **AMENDMENTS TO THE SPECIFICATION**

Amend the TITLE as follows:

FIBER OPTIC-BASED PROBE FOR USE IN <u>SALTWATER AND SIMILARLY</u> CONDUCTIVE MEDIA <u>AS FOUND IN UNENCLOSED NATURAL ENVIRONMENTS</u>

## Amend the ABSTRACT as follows:

Using aArrays of optical fibers connected to specially configured electronics, e.g., a phototransistor, an LED, an amplifier, a detector, and display, software and PCMCIA A/D board available on a personal computer, are used to obtain continuous real-time acquisition, processing, and visualization of change in a monitored medium is providedmedia occurring in natural environments. MAlternatively, many of the individual circuit elements above may be replaced with a power meter in an alternative embodiment. In a specific application, secur data are collected on the depth of sediment below a body of water. As the sediment depth is eroded changed by an event, the ends of the optical fibers in the array display a different reflection or transmission coefficient indicating that water has replaced sediment or vice versa. By knowing which of the optical fiber ends in the array is indicating the changed reflection or transmission coefficient, an estimate of how much scour depth or silt accretion has occurred is provided may be estimated. A method of employment of the system is also provided described.
